US Macroeconomics

Troy Ludtka, Senior US Economist | 212.224.5483 | troy.ludtka@smbcnikko-si.com

The Gears of Higher Unemployment are in Motion

So far, the unemployment rate has moved up 50 basis points (bps) from April's 3.4% cyclical low, which historically is a fatal threshold preceding recession. Critics of this well-known technical indicator suggest this may not be valid today because folks are largely coming off the sidelines into a state of 'unemployment.' There have been 441k of these flows since April. Compare this to the more noteworthy case of job cuts where there have been only 134k net cuts over the same period. In other words, unemployment is rising because people are increasingly failing to find jobs when entering the labor market. Yet, this distinction is just as telling on the health of the labor market as the more odious case of outright job cuts, in our view. Why? Labor demand slows first, then it is cut. Most of the available data (openings, payrolls, labor force flows, continuing claims, et al.) suggest the US labor market is still in the first part of this sequence (slowing demand), but maybe not for long.

Recessionary headwinds are mounting, and this is likely to usher in job cuts (the second part of the sequence). One of our preferred momentum-based indicators illustrating this is the unemployment rate less its 24-month moving average, which is charted below. When the former exceeds the latter — denoted by readings above zero — the economy has historically entered recession (albeit with two brief, false positives in 1963 and 1967). This indicator's present reading of +20 bps suggests recession is on the horizon.
